Subject:	Data from re-analysis of some EHC study samples

Dear Bob and Kirk–

Please find attached an Excel file from Covance presenting Total Nicotine data from the EHC confinement study. The 'original' results are from a batch which has subsequently been found NOT to have met acceptance criteria, a calibration standard >15% (46%) DMT not having been excluded from the regression (for nicotine only). These 'original' data were supplied to you initially. The samples were re-analyzed after this failure was identified, and the column 'revised' results in the spreadsheet are from a recent re-analysis of the samples. This re-analysis batch met all acceptance criteria.

datarevi.xls

The original results for Subject 082 were invalidated due to batch failure as previously reported. However, the table showing original and new measures for that subject did not open properly, and I will have to speak to Harrogate tomorrow about acquiring those results.

Please call me if you have any questions.
